PRODUCT CATALOGUE

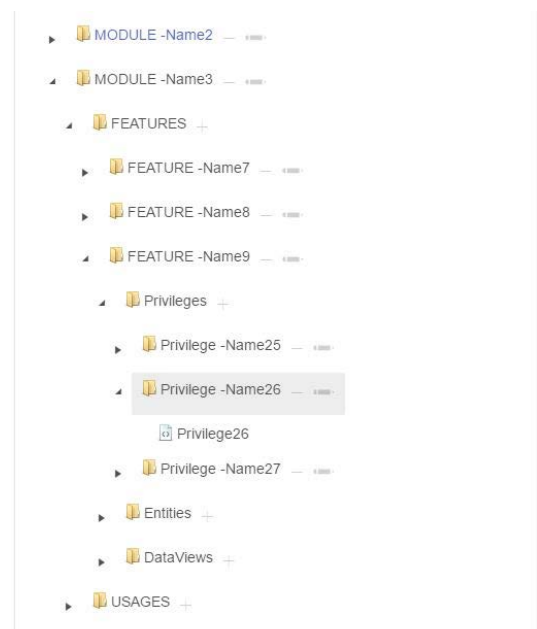

Product Catalogue Management

Techcello allows product owners to associate multiple service/product on their portal and provides access to customers across products. Techcello product management feature offers a central management platform for the entire product as a product suit. In order to access a service/product a License validating the access to the product and package for subscription is used. When a tenant subscribes to any product a License validating his access to the product is generated. This license also seamlessly integrates with provisioning, metering and payment systems.

Product Structure Management

Product owners can create multiple Modules, Features, Privileges and the entire structure of a product on the fly and manage the entire service centrally. This composition forms the base for building multiple editions.

Edition Management

Techcello Edition Management is an effective SaaS based packaging solution, enabling product owner to package multiple modules, features and business parameter usage into a single logical groups based on Licenses or pricing plans for their different Services/Products. As part of the security framework, Cello validates the type of the license subscribed and its modules and features in the given license, and blocks the usage of unsubscribed Features. Package editions can be given with or without Trial period.

TENANT MANAGEMENT

Customer Provisioning and Subscription Management

Tenant Management is one of the core modules of Techcello application. Manage complete Customer Onboarding process using a central portal. Subscriptions of the customer to various products are also managed via the portal. Each of your customers is termed as tenants. Tenant Management dashboard provides an overview of all customer accounts managed within your application. From this view you can search by tenant name, subscription package, status and any other assigned attribute. The filters on this view allow you to filter accounts by different categories for easy sorting.

Highlights

- Add/Remove Customer from the System to any level of hierarchy
- Manage Customer data such as Address, Contact Details, Billing Address, etc.
- Map subscription plans for the customers
- Tenant export / import feature enabled from CSV/excel files

Customer Hierarchy Management

Techcello supports a hierarchical tenant structure i.e. a Customer of a SaaS Product can have Sub tenants. These Sub tenants can then create Tenants as their child and so on. These Child can act as a standalone independent Subscribers, and having rules/protocols applied by their Parent Subscribers. The state of having customer under a customer and maintaining relationship between different entities is generally called as tenant hierarchy.

In the complete hierarchical structure, the product owner is the Primary tenant of all tenants, only the application provider will be able to create the primary level tenants. These tenants can then create sub tenants under them and this will go on up to n Level and there is no restriction in the number of nodes created under them.

Reseller Tenant Management

Support for reseller enables the product owner to sell the product in a Reseller/Distributor Model. In the Reseller model, the reseller tenant may or may not use the product himself and simply sell the product to other customers. In this model, Reseller might pay a percentage of the revenue to the Product Provider made by sub selling the product to its customers.

Billing and Invoicing

Techcello Billing Engine is a standalone module that takes care of all the billing and invoicing needs of any Subscription based businesses. Cello automates the process of raising the invoices based on the frequencies set by the product owner, bill the customer based on the usage, apply taxes, Automatic Payment Collection, Notification etc. Billing Engine is integrated with Subscription module of Cello by default, i.e. when a subscription plan is created, it can be simply hooked with billing plan to raise invoice based on the frequency set by the Product owner.

CUSTOMER IDENTITY, ACCESS AND FEDERATION MANAGEMENT

Customer Identity, Access and Federation Management

Cello offers a flexible and powerful customer Identity management system specialized for SaaS needs. It provides a user friendly administration console to provision and manage users. Users can manage their profile and password by self-service. Customer administrators can login to the portal and manage the customer's users themselves. Product Admin can also provision the users on behalf of the customer administrators. A complete audit system for various membership activities of the user is available.

Role Management

Techcello's intuitive Roles Management allows the tenants to create global and local roles at tenant level for multiple product lines. Role management controls what a user can access or cannot within the system

Roles have the following characteristics

- Create Local & Global Roles
- Copy the Roles from the parent tenant to the sub-tenants.
- A particular set of privileges can be identified as a role and assigned to a user.
- You can assign users to more than one role. When a user is assigned to multiple roles, the role with the more restrictive prevails
- All changes to roles such as changing role definitions, granting, or revoking roles to and from users take effect upon new login sessions
- When you deny access to a module, the related features that display on other module are also removed

      }
    }
  },
  "/tenant/*": {
    "RuleString": "(P:DRM_Admin ) AND S:ShareUsers"
  }
}
```

CONFIGURATION MANAGEMENT

Configuration Management: Template Management

Template management is a component that enables the product owner to manage the application wide (Both System and Application) configurations like setting default values and assigning it to Tenants. Settings can be maintained for each product at a tenant level. It can also be mapped to Tenants and Sub Tenants, and these attributes will be applied to Tenants at the runtime.

Example

While creating a Tenant in any SaaS system, the administrator has to apply some default settings such as default logo, themes, password expiration date etc.

Types of Template

Fixed Template:

The default values assigned by the vendor will not be able to change by the customer

Custom Template:

The default values assigned by the vendor is modifiable by the customer

Highlights

- Configure System settings at a tenant level
- Configure System settings at a role level within each Tenant
- Configure System settings at a user level
- Roll down Parent Tenant configurations to sub-tenants. Allow sub-tenants and users to change configurable attributes

Configuration Management: Field Customization Metadata Management

Every Tenant has unique needs to be addressed with respect to the data they capture and process. While the application can be designed to capture the core or basic data, it needs to offer the ability to extend this data according to the tenant's requirement. In such cases, Capturing additional details would be decided by a tenant during the configuration process and hence the SaaS application should have the ability to extend the data model defined for a customer. In order to support this, Techcello offers the feature "Data Model Extension" which enables the developers to bring in the data extension support very easily.

MICRO-SERVICES

Notification Micro-service

Every product needs to send out multiple notifications including SMS and Email out to customer. Notification system is available as Microservice that can be seamlessly integrated with the product. Notification allows the Customers/Tenants to control the content of the email, including dynamic placeholders etc. These placeholders will then be replaced with the dynamic content while sending out the email/system notification. Notification system captures all the sent out notifications and audits it.

Dear Chris,

 You've been granted access to KPMG Tax Control Room

 You can access Tax Control Room via your KPMG Spectrum account

 If need assistance in setting up your KPMG Spectrum account, please contact
KPMGAdmin.

 Please activate your account using your temporary password **iRukW#67**

 We recommend you bookmark or favourite the login page URL.

Business Event Management Micro-service

Techcello Event system is available as a full blown Microservice that can be integrated with the products seamlessly. Cello provides the application to run various jobs as per the tenants need in the occurrence of the system event. "System Event" is any event of interest that happens in the application that requires special attention, like Add / Update / removal of an Employee, order confirmation etc. The developer only needs to identify various events that must be raised in the system and uses Techcello Event API to raise them.

At runtime the tenant admin can configure what a job must run when the event happens and this is configurable via the user interface. The various jobs that the tenant may require may be thought through and should register it with Techcello so that the tenant can pick one.

Workflow Micro-service

Workflow is a term used to describe the tasks, procedural steps, organizations or people involved, required input and output information, and tools needed for each step in a business process. All the products need some kind of workflow. Cello offers a configurable work flow available as Microservice which can be integrated with the products. Workflow offers a centralized designer and monitoring dashboard for the workflows.

DEVELOPMENT FRAMEWORK

Web API boiler plate

Cello also offers boiler plate code with best architectural practices to quick start an API development. It ships with templates that can cut down significant amount of time to develop APIs. Productivity boost is almost 50% while using the boiler plate.

SPA boiler plate

Cello also offers boiler plate code in Angular with best architectural practices to quick start SPA development. This cuts down significant amount of time to develop SPA based applications.

ABOUT US

Founding team of Techcello has worked on several SaaS initiatives for various ISVs and observed the challenges that every engineering team faces while building a SaaS product. Success of the product depended on the team's prior expertise in building SaaS. Every team has re-invented the SaaS architecture to suit their needs. Lot of time and money gets burnt in putting together the SaaS foundation before a single line is written on business application (eg. Healthcare, CRM, Procurement Software, etc.)
